

- Assign video curation to anyone with a web browser
- Detect content such as sexual or violent situations, with extensible language recognition
 - Offload scarce editorial personnel, equipment and resources
 - Accelerate your localization efforts and content platform customization

How it Works

1. Upload videos, they automatically run through the AI/ML (you can customize the vocabulary search)
2. Select a video from your displayed list
3. Select or jump to timeline markers where flagged content or language occurs
4. Designate each as "delete", "keep", or add a note
5. When finished, export an Edit Decision List or Marker file for use in final edits

Name	Status	Created	Completion	Markers	Reviewed	Notes
